A spatially resolved study of hard X-ray emission in Kepler's SNR:

Indications of different regimes of particle acceleration

SNR as source of cosmic rays

Synchrotron emission is a powerful tool to study:

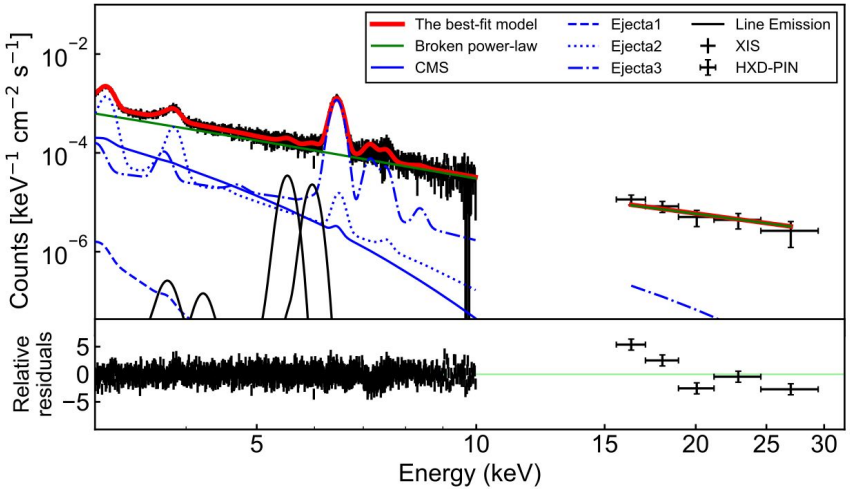
- The distribution the accelerated electrons
- The mechanism that limits their **maximum energy**

Young SNRs have high shock velocities

Good acceleration efficiency

We chose the young **Kepler's SNR**

First detection of **hard non-thermal** X-ray with Suzaku



Nagayoshi et al. (2021):

***Suzaku** X-ray spectrum of Kepler's SNR*

Hard non-thermal X-rays of Kepler's SNR

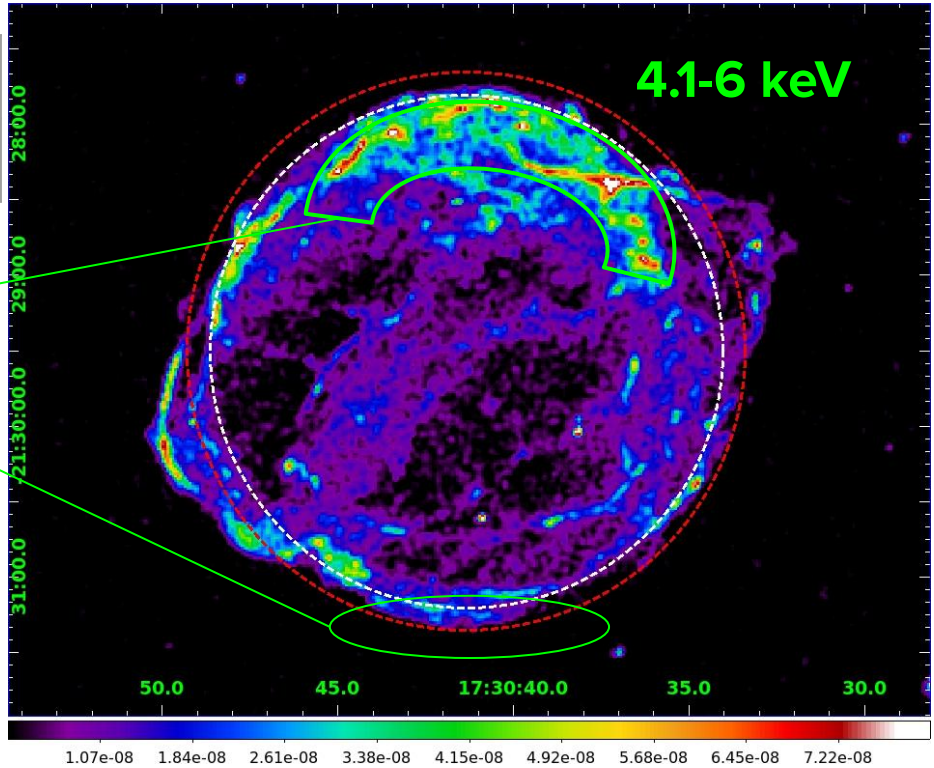
Distance (pc)	Age (yrs)	Physical origin
~5000	418	type Ia SN

Shock interacting with dense circumstellar medium
v_{sh} ~ 2000 km/s

Shock expanding in subtle homogeneous medium
v_{sh} ~ 5000-6000 km/s

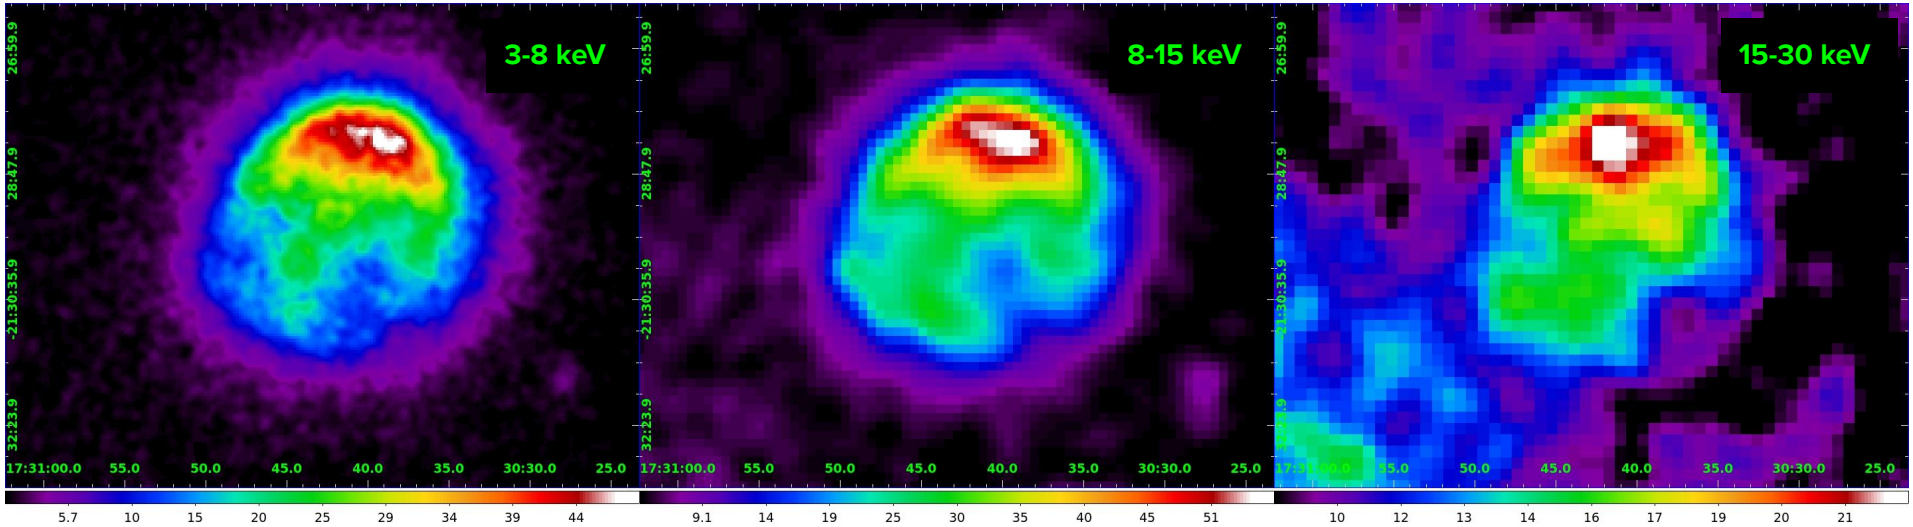
Spatially resolved spectral analysis

Non-thermal radiation from Kepler's SNR



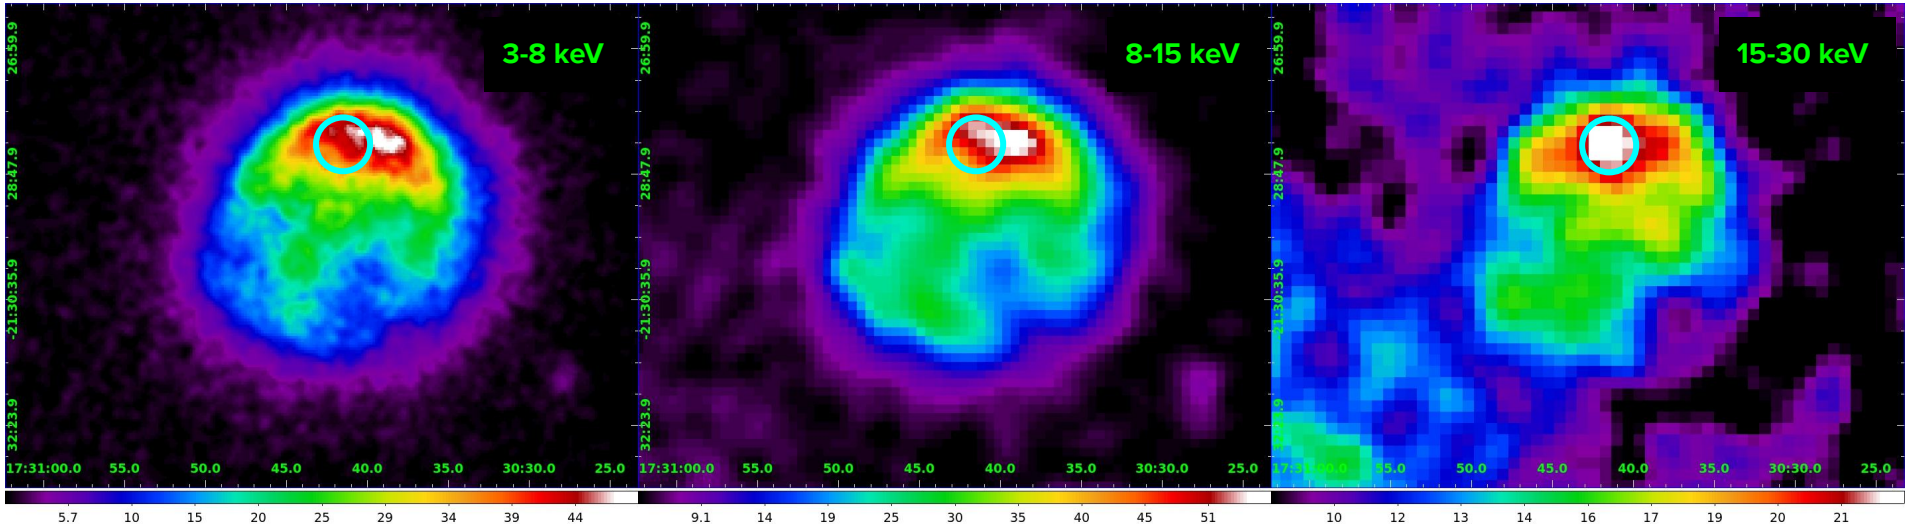
***Chandra** flux image*

First Hard X-rays Images of Kepler's SNR



Sapienza et al. Subm. to ApJ: ***NuSTAR*** *counts images in 3-8 keV, 8-15 keV and 15-30 keV from left to right*

First Hard X-rays Images of Kepler's SNR



Sapienza et al. Subm. to ApJ: ***NuSTAR*** *counts images in 3-8 keV, 8-15 keV and 15-30 keV from left to right*

Loss limited model

Loss-limited spectrum model is (Zirakashvili & Aharonian 2007):

$$\frac{dN_X}{d\varepsilon} \propto \left(\frac{\varepsilon}{\varepsilon_0}\right)^{-2}\left[1+0.38\left(\frac{\varepsilon}{\varepsilon_0}\right)^{1/2}\right]^{11/4}\exp\left[-\left(\frac{\varepsilon}{\varepsilon_0}\right)^{1/2}\right]$$

cutoff photon energy

$\tau_{sync} \sim$ 60 yrs (B=100 μG E=20 TeV)

$$\tau_{sync} \approx 12.5\left(\frac{E}{100\mathrm{TeV}}\right)^{-1}\left(\frac{B}{100\mu\mathrm{G}}\right)^{-2}\ \mathrm{yrs}$$

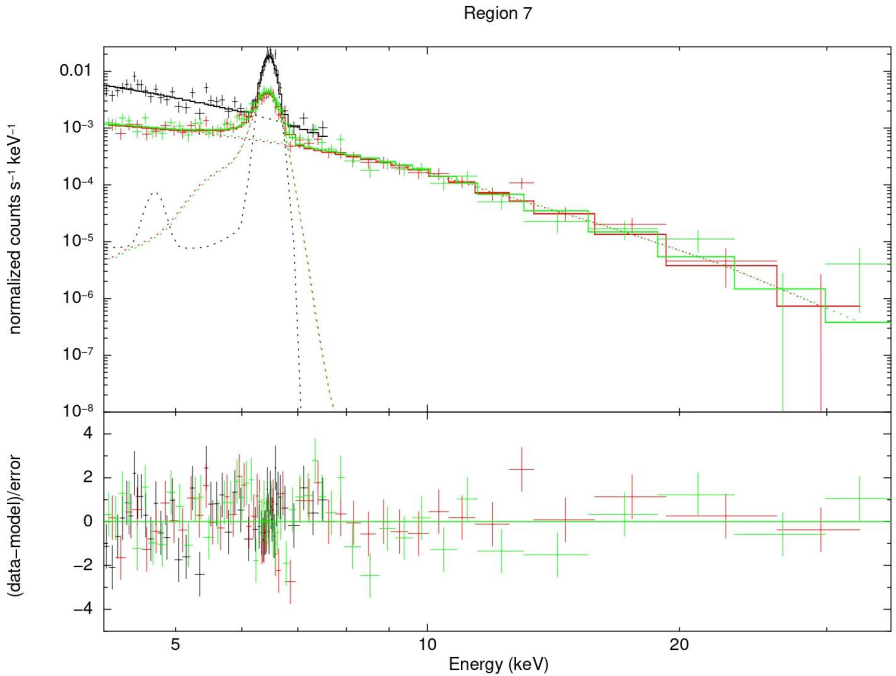
$\tau_{sync} < \tau_{age}$

Relation between ε_0 and shock velocity

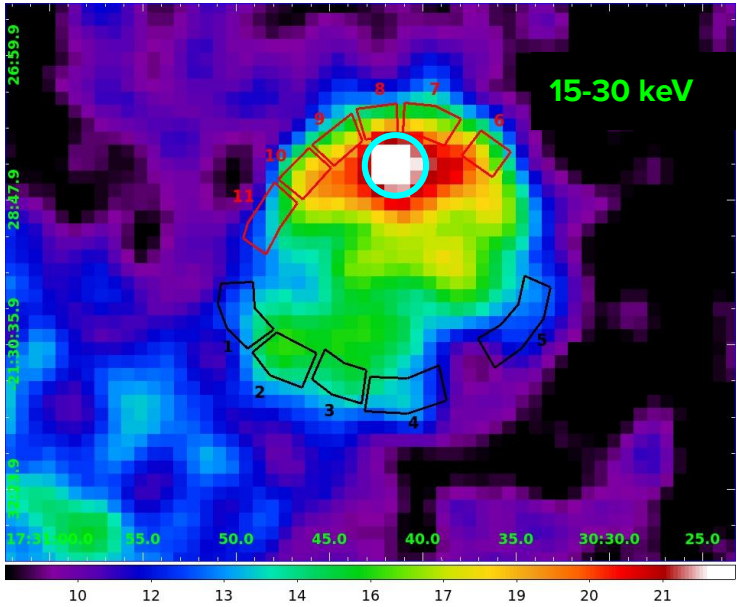
$$\varepsilon_0 = \frac{1.6}{\eta}\left(\frac{v_{sh}}{4000\ \mathrm{km\ s^{-1}}}\right)^2\ \mathrm{keV}$$

η related to the magnetic turbulences

Spatially resolved spectral analysis

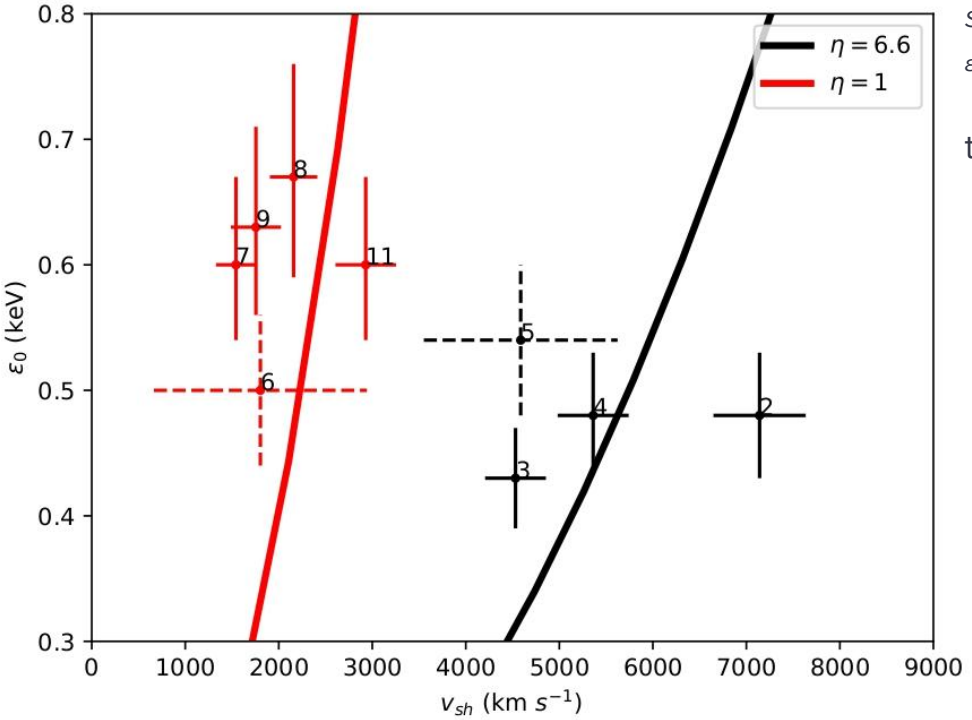


Sapienza et al. Subm. to ApJ: pn (black) FPMA (red) and FPMB (green) spectra of region 7 with best fit model and residuals in 4.1-30 keV band



Sapienza et al. Subm. to ApJ: NuSTAR counts map of Kepler's SNR in 3-8 keV band

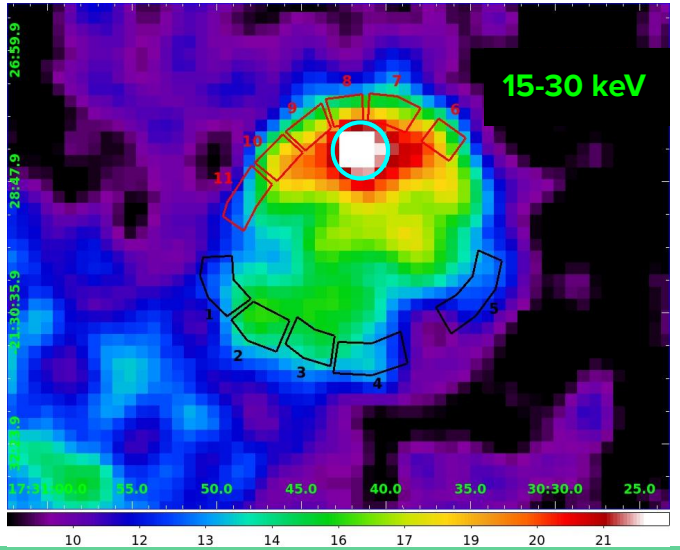
ε_0 vs. current shock velocity



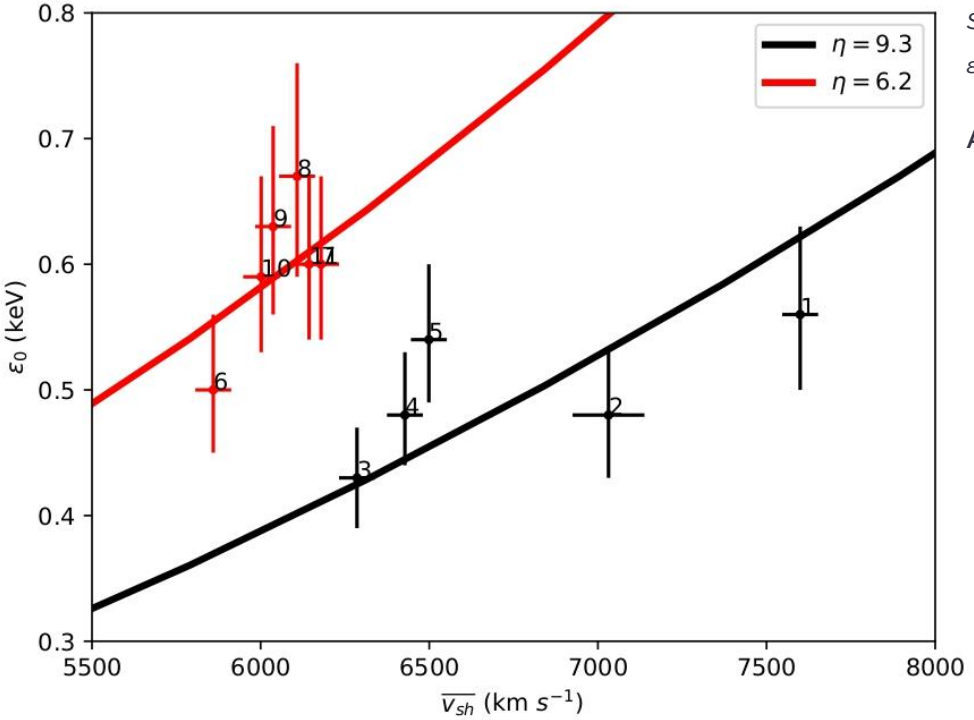
Sapienza et al. Subm. to ApJ:

ε_0 vs. Coffin et al. (2022, Solid crosses)/Katsuda et al. (2008, dashed crosses) v_{sh}

t_{acc}~300 yrs using v_{sh} from northern regions and B=100 μG



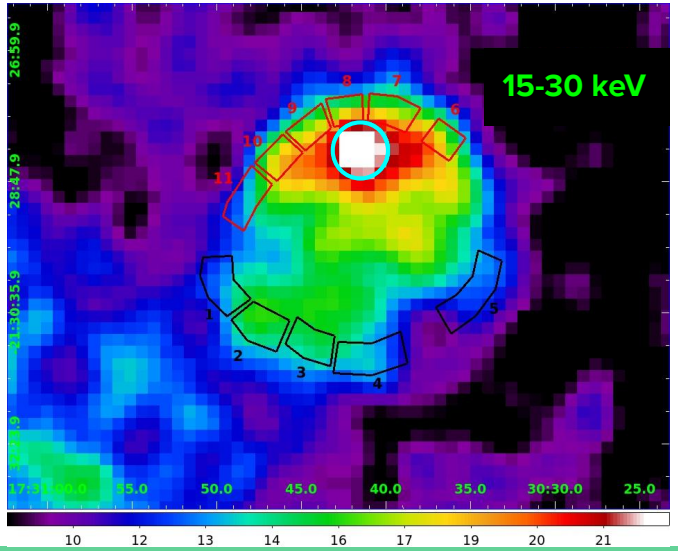
ε_0 vs. average shock velocity



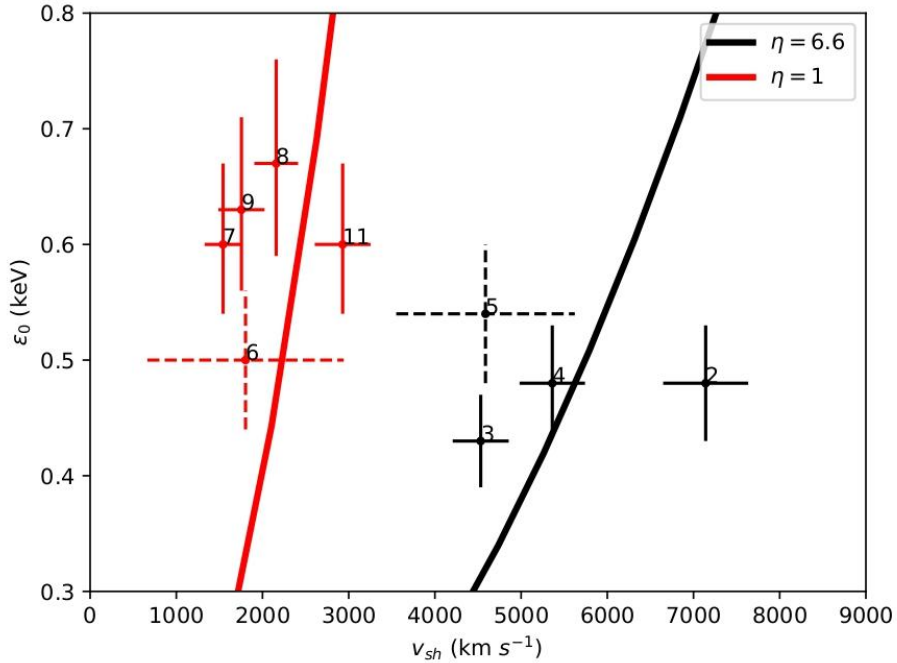
Sapienza et al. Subm. to ApJ:

ε_0 vs. average velocity using Sato & Hughes (2017) center

Average shock velocity = shock radius / age of the remnant

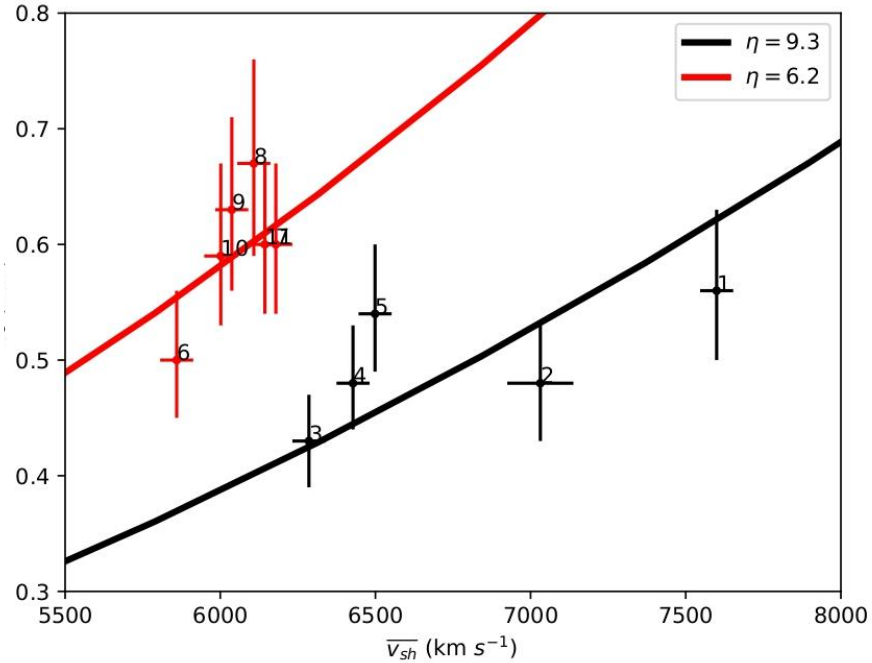


Two different regimes of acceleration



Sapienza et al. Subm. to ApJ:

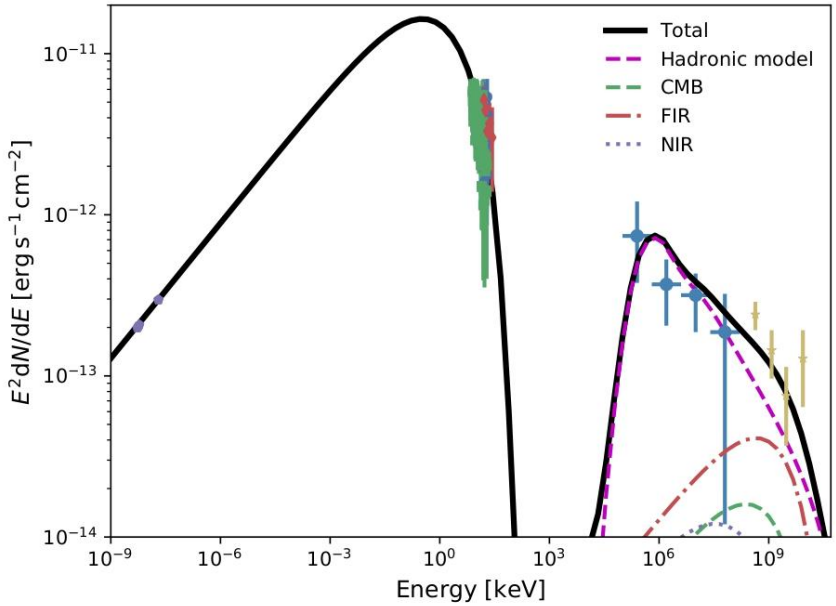
ε_0 vs. Coffin et al. (2022, Solid crosses)/Katsuda et al. (2008, dashed crosses) v_{sh}



Sapienza et al. Subm. to ApJ:

ε_0 vs. average velocity using Sato & Hughes (2017) center

Spectral Energy Distribution



Sapienza et al. in prep: Radio: DeLaney et al. (2002). X-ray: Sapienza et al. in prep, Nagayoshi et al. (2021). γ-ray: Acero et al. (2022), Prokhorov et al. (2021).

Recent detection of γ-rays from Kepler's SNR

X-ray data from this project

One-zone Lepto-hadronic model:

- Synchrotron for X-rays and Radio
- Inverse Compton and Pion decay for γ-rays

α	E_{cut} (TeV)	B (μG)	n (cm^{-3})	W_p (erg)
2.44	16	100	20	4.2×10^{48}

Summary

First data analysis on NuSTAR data from Kepler's SNR

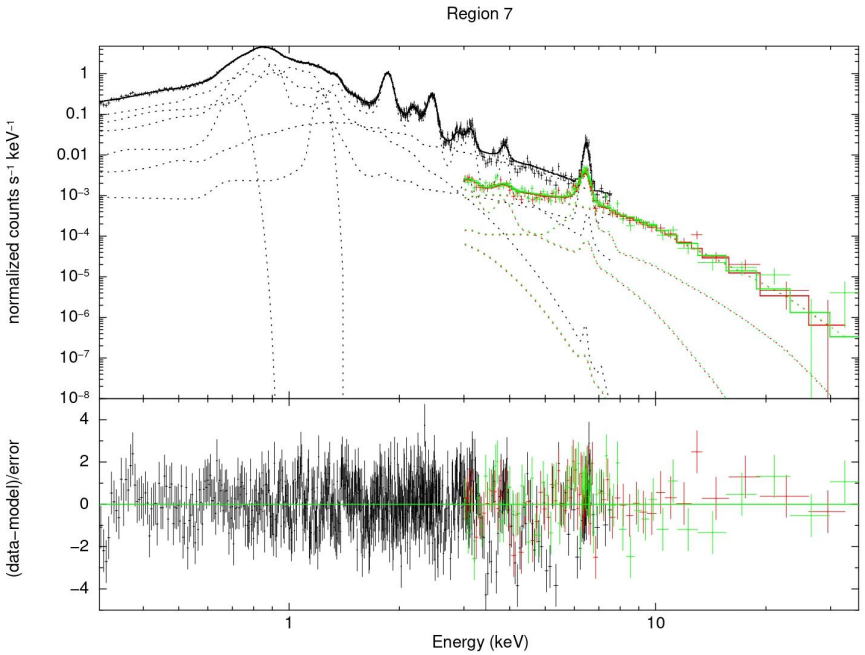
Spatially resolved spectral analysis with a loss limited model

Brighter non-thermal emission in the north than in the south

Electrons in inhomogeneous medium northern regions are accelerated closer to Bohm (effect of turbulences?)

SED: Indication of hadronic acceleration in Kepler's SNR

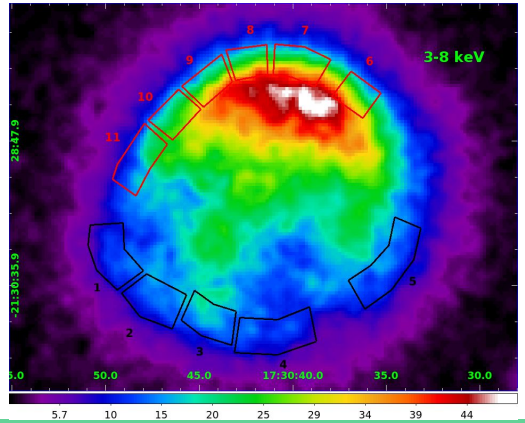
Broadband spectra as crosscheck



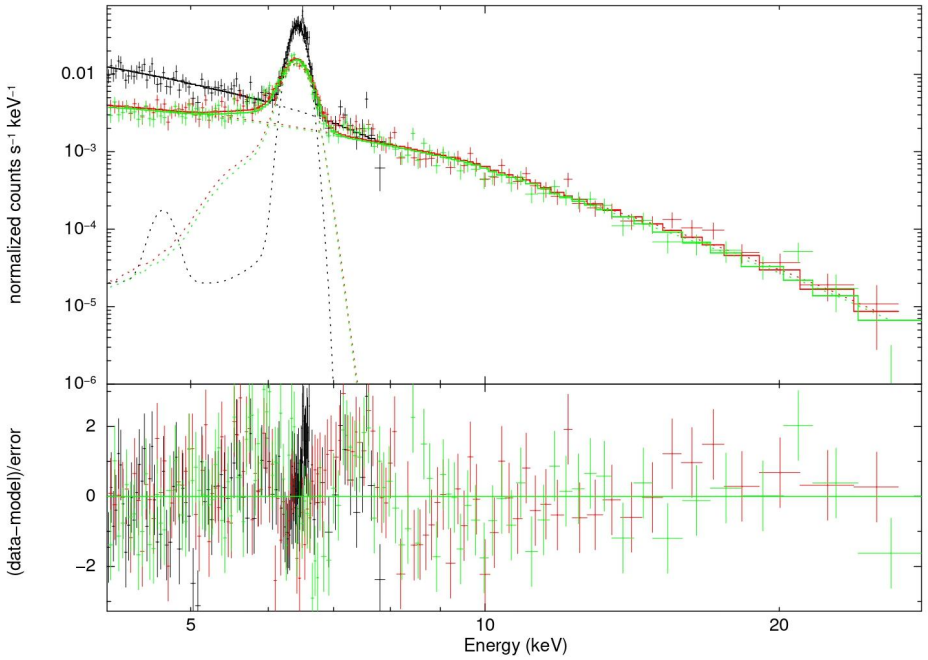
Sapienza et al. Subm. to ApJ: pn (black) FPMA (red) and FPMB (green) spectra of region 7 with best fit model and residuals in 0.3-30 keV band

Model with three thermal components and loss limited model

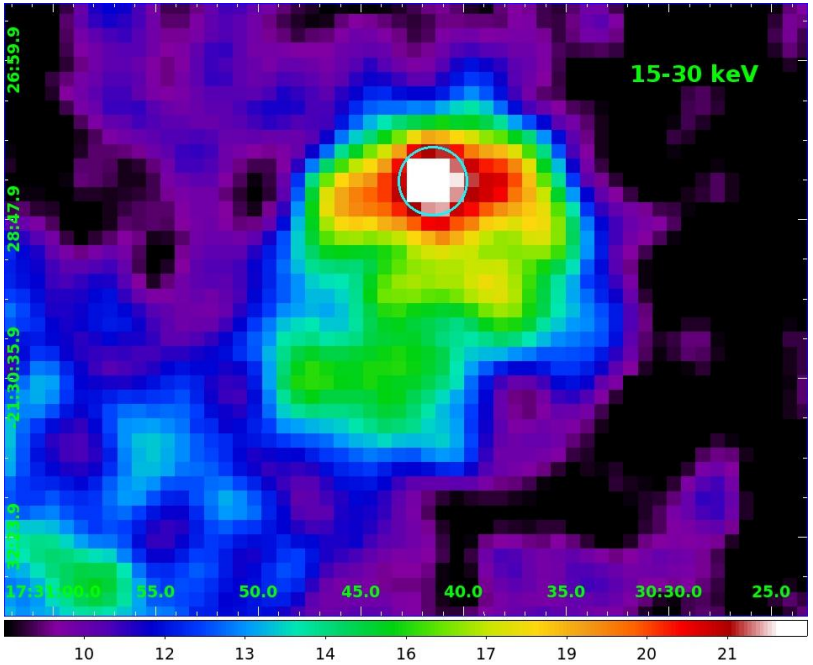
$1 < \chi^2 / d.o.f. (400\text{-}700) < 1.4$



Hard Knot spectrum

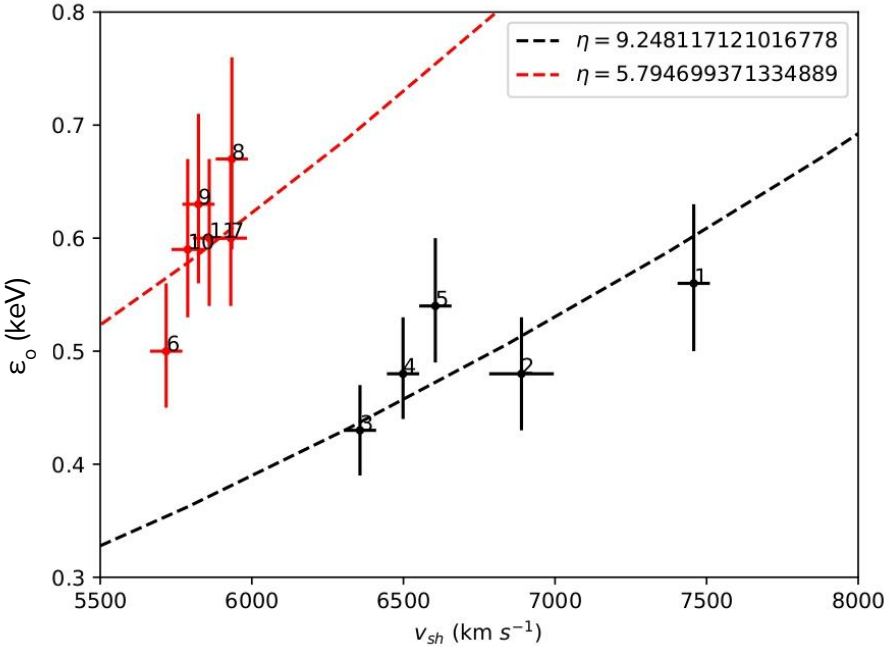


Sapienza et al. Subm. to ApJ: pn (black) FPMA (red) and FPMB (green) spectra of hard knot region with best fit model and residuals in 4.1-30 keV band

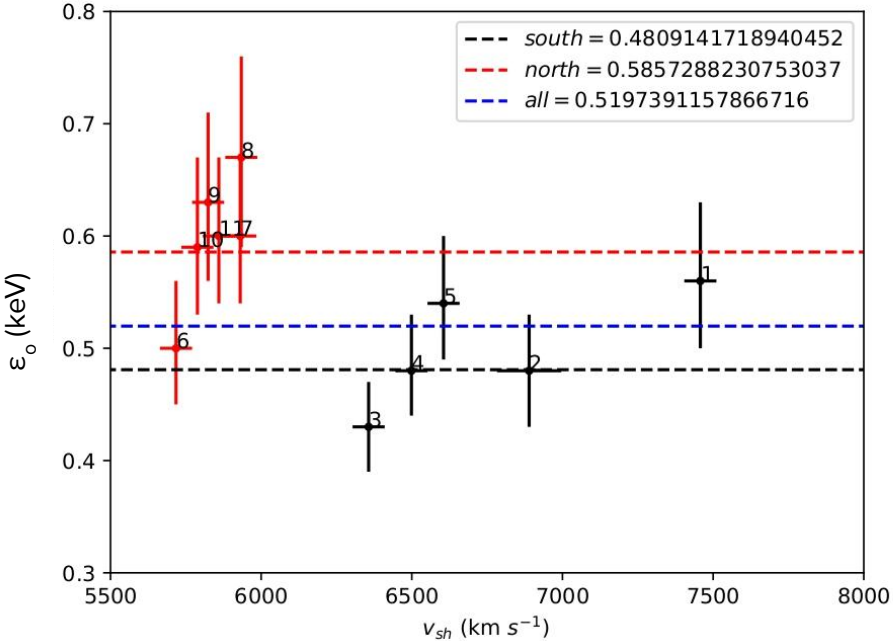


Sapienza et al. Subm. to ApJ: NuSTAR counts map of Kepler's SNR in 15-30 keV band

Quadratic vs. constant



null hypothesis probability~95%



null hypothesis probability ~15%
